Weekly Report

Week 16 — June 1–5, 2026

Mithun Manjunatha — Sales Engineer

Open Exchange | Confidential

Week 16 Overview

Week 16 was defined by three converging threads: closing the final mile of the IFRS Kaltura-to-Zoom migration while catching and fixing a series of late-breaking technical issues, escalating and resolving a Zoom platform gap that threatened to invalidate the entire Indeed migration, and advancing the Vault Jump migration bot toward Zoom App Store productization. A late-breaking caption file bug — an SRT-to-VTT conversion function written but never wired into the pipeline — required rapid triage, and a second caption-linking failure followed before both were resolved. On the Indeed front, a legal-triggered 30-day clips retention policy that would have auto-deleted all migrated content was escalated directly to Zoom's ZVM product manager, resulting in a committed roadmap item: a bulk API to star clips on behalf of users during migration, exempting them from deletion. The week also brought deep cross-functional education through calls with Devin on OE's earnings and investor-day pricing model, a Contact Center strategy session with Alan and Tyler, and a Webinar Plus and HubSpot integration setup for Energized Marketing.

IFRS Migration: Final Mile Complications

The last week of the IFRS engagement surfaced a cascade of late-stage technical issues that required rapid resolution before the Tuesday client presentation. An SRT-to-VTT caption conversion function was discovered to be written but not wired into the pipeline, causing caption files to be silently dropped across a large portion of the migration. A second linking bug followed when Zoom returned 500 errors during the caption patch run, leaving captions uploaded but disconnected from their entity IDs. Both issues were diagnosed and fixed within 24 hours. Separately, four manually migrated entries hit a tag character limit, eight Kaltura quiz videos required manual recreation in Zoom due to a platform timing-gap difference, and one entity remains under Zoom engineering investigation for a "not found" error. The final report and client presentation are scheduled for early Week 17.

Indeed Retention Crisis Resolved at Platform Level

A legal-triggered 30-day clips retention policy, already live on Indeed's Zoom account, threatened to auto-delete all 7,000 migrated Kaltura videos within a month of migration, rendering the engagement pointless. The team escalated directly to Zoom ZVM product manager Vijay and engineering lead Bo on Friday's call. Vijay confirmed Zoom Whiteboard already supports a "save starred" exemption from retention deletion and committed to implementing the same for Clips, including a bulk API so OE can programmatically star clips on behalf of users during the migration run. A second exemption for clips added to ZVM channels is also under discussion. Vijay also provided the embed-code construction pattern, enabling OE to deliver a dual-link report mapping old Kaltura URLs to new Zoom URLs for Indeed's re-embedding work.

Vault Jump: Bot Architecture and Go-to-Market Taking Shape

The migration bot — internally named Vault Jump, with the virtual assistant persona "Dot" — moved from experimental to structured this week. Akash deployed major architecture changes and confirmed the bot is testing successfully in the sandbox account. Mithun and Akash aligned on a customer questionnaire flow requiring only a minimal set of required fields (source platform, destination,

credentials, data residency region), with all other information ingested optionally. A GitHub MCP connector will give the bot persistent, always-current API context from the migration repo. Mithun also confirmed Zoom's in-app framework supports both free trials and direct payment, making in-app monetization viable without external infrastructure. Akash was directed to move testing to the corporate Zoom account where ZVM licenses live, as the next two migrations (Okta and Indeed) both target Zoom Video Management.

SE Fluency: Earnings Model, Contact Center, and Client Enablement

Week 16 delivered a concentrated education in OE's broader product and commercial landscape. Devin walked Mithun through OE's earnings and investor-day business in detail: four-pack and eight-pack pricing structures starting at roughly \$2,950 per call, investor days ranging from \$10K to \$100K, the full delivery workflow from kickoff through 24-hour post-event deliverables, and the managed-service moat against Q4 and Notified. A Contact Center strategy call with Alan and Tyler confirmed June 15 as the support-line go-live date, with 10 Zoom-issued Mac laptops shipping to OE agents and a trial Elite license providing AI engagement briefs. The American Bankers Association loss on the slide-upload gap was formalized as product feedback for Zoom. Energized Marketing's HubSpot-to-Zoom Webinar Plus integration was established end to end.

Note: Created in tandem with AI to summarize meeting notes. Every line read and verified.

Monday, June 1

5 meetings

Power BI MCP Connector Enablement — Internal

Connor walked the OE team through the Power BI MCP connector that allows natural-language queries against OE's semantic models in Claude via VS Code. Authentication was blocked by an IT permissions loop affecting both Max and Michael; Connor committed to working with Alex Keefe to resolve the connector this week. Two relevant semantic models were identified: financial reports and the broad delivery-manager reports with Salesforce data. Mithun asked whether earnings/investor-day presenter names, registrant counts, and attendee data could be surfaced; Connor confirmed the delivery-manager model with Salesforce data should cover most of it, though PII registrant data is intentionally excluded from Power BI.

Migration Internal Sync — Citi Handoff, IFRS Close-out, ZVM Bot Architecture — Internal

Mithun, Max, Akash, and Meet covered three threads. On Citi (635 GB of content in OE's S3), Akash presented five transfer options and Mithun reframed the decision around ownership and cost, recommending Citi own their S3 with OE providing credentials and maintenance, while noting the real question is where the data goes long term. On IFRS, 15 entities that failed on the old tag limit were remigrated; Meet will run a blanket repatch of tags, full metadata, and thumbnails. Two corrupt source files were logged manually; one post-cutoff entry was also handled manually. On the ZVM bot, the S3-to-S3 proof of concept works but Lambda's 15-minute timeout and 3 GB limit forced an architecture redo for the MVP. Mithun pushed for a self-serve customer experience: questionnaire intake to implementation plan to pricing.

Citi Data Transfer Escalation — Internal

Andrew, Alan, Joe, Max, and Mithun escalated the Citi handoff after Citi could not stand up their SFTP server. With 635 GB ready in OE's bucket, Joe and Alan agreed the move is to get Citi on a call and let their technical contact name a bank-approved transfer method, with OE granting limited bucket permissions. The team decided against standing up an OE-side SFTP, and a Zoom-based transfer was ruled out for lack of an agreement. Andrew will reach out and push Ian for an early-week call.

GCS Sales Weekly Kickoff + NIRI Prep — Internal

Andrew and Amelia framed the Q2 push with four weeks remaining. IRO advisor Lorna (ex-Credit Suisse) coached the team ahead of NIRI in Chicago: lead with topical conversation such as the sitting SEC chair's appearance and the 2x-vs-4x reporting debate, and position OE as a problem-solver. Pipeline highlights included Lenovo migrating from Veracast to Novio for a World Cup press event, the American Bankers Association at roughly \$200K for 175 webinars per year, DocuSign town halls, and Agilent. Peter showcased proactive Bain outreach off a luxury-brand event. The team flagged competitor Octus for bot-based session recording and discussed the "corporate bot agent controlling the narrative" theme as a NIRI conversation opener.

Energized Marketing — Webinars Plus + HubSpot Integration Setup — Client

David and Mithun supported Michael and Melissa of Energized Marketing in standing up their new Webinar Plus license and Zoom Events hub, branded as Tech Talks. They created a single-session simulive event for an IBM webinar on June 25 on intelligent modernization. The bulk of the call was troubleshooting the Zoom Events–HubSpot integration: the app was missing from HubSpot's marketplace after a prior install left a dummy account, and reinstalling from the Zoom app marketplace re-established the connection. The team built a HubSpot workflow (form-submission trigger to register users in Zoom Events) and discussed group join links versus unique authenticated links. A custom-domain branding question was left open for follow-up.

Tuesday, June 2

3 meetings

IFRS Close-out + Migration Bot App-Store Strategy — Internal

Mithun joined an internal call with Alan, Joe, and Max. On IFRS, metadata had been repatched over the weekend and Mithun was running manual QA and rebuilding playlists, with a completion report and paid onboarding package push to follow. Active pipeline: Indeed had raised platform concerns ahead of a meeting the next day; Okta reduced scope by dropping embed-replacement work, leaving a simpler content migration with an updated proposal sent. The strategic thread centered on productizing the migration bot into a source-agnostic Zoom App Store app that ingests a questionnaire, generates a pre-migration discovery report, stands up infrastructure per migration, and gates users to engage OE support first. Alan pushed for a test data set and regression suite before submission and noted an app is already deployed but not yet public.

WWE/TKO Zoom Consolidation — Technical Discovery — Client

A Zoom-led implementation-plan review was rescheduled when Rich and Tim Quinlan were left off the invite, but Peter, Brian, McKinsey, and Mithun used the slot for productive technical discovery with Terry, Lenny, and stand-in Brandon. The plan: consolidate WWE and TKO under one Zoom portal via Okta SSO using two Zoom user groups, one for WWE and one TKO group for all other entities. Okta currently sends all groups via regex; Zoom selects by response-mapping priority. Phone configs stay intact. Identical groups must be staged in both Okta environments (four groups total) ahead of migration. Marching orders: create and stage those groups in both Okta environments before the rescheduled meeting with Rich, Brooke, and Tim Quinlan.

Migration Bot Monetization + Contact Center Strategy — Internal

Mithun and Max held a strategy screen-share on productizing the migration bot and the Zoom Contact Center. Mithun demonstrated Zoom's in-app framework supports free trials and direct payment natively, making in-app monetization viable. He clarified the bot is used internally by the OE team (Jira tickets ingested, bot executes migrations in Zoom's environment) and proposed a GitHub MCP connector for persistent LLM context. Max enabled Zoom AI Studio; they explored knowledge bases, the virtual agent, and the workflow builder (web chat, collect input, skills-based routing, Salesforce HTTP connectors). Max set Mithun up as a Contact Center agent. The open problem: gating support access (Fresh Desk auth, Salesforce validation, session-limit tracking), which Mithun framed as a KYC challenge. The S3-to-S3 migration with Vijay was named the next priority.

Wednesday, June 3

6 meetings

Migration Standup — Final IFRS Report Columns, JSON Scope, Vault Jump — Internal

Akash posted updated implementation and architecture documentation. The main thread was the final IFRS report after the metadata repatch; the team debated columns, with Mithun and Max requesting a JSON-file count column to explain why only one of two attachments migrated (Zoom does not yet support JSON attachments), permanent-hold reason and phase columns to flag entries with no media or zero size, and ideally a Zoom video-link column. Zoom only exposes a shareable link once a video is added to a channel, so that column was deferred. One failed entry, 07U52KELC, remains under Zoom investigation; three of four other failures were handled manually. Citi has no update pending follow-up with Ian. One-on-one with Akash: aligned on persistent LLM memory from Jira, a GitHub MCP connector, a four-field required questionnaire flow, and in-app monetization, with a Friday reconnect.

Indeed Migration Blocked by Zoom Clips Retention Gap — Client

On a joint call with Indeed, OE (Max, Mithun, Kara) and Zoom (Andrew) worked through a retention crisis triggered by Indeed's legal team tightening content retention from 180 days to 30 days effective June 30 with no end-user retention path. The core blocker: Zoom Clips has no retention exemption and no do-not-delete option, so migrating Indeed's roughly 7,000 Kaltura videos into Clips would see them purged in 30 days. Indeed had already permanently deleted 400,000 videos and wants only keepers migrated. Their preferred ask: one-to-one migration into cloud recordings with a do-not-delete flag, linked to unpublished ZVM channels. A key reframe emerged: Indeed uses ZVM purely as a hosting library to embed videos into LMS, Huddle, and global comms, not as an internal viewing platform. Indeed also requested a full Google Drive backup. Kara scheduled a Friday call with Zoom product (Vijay), and OE confirmed all content staged in S3.

Indeed Debrief — Internal

Mithun and Max confirmed Indeed is using ZVM purely as a hosting library to embed content into other platforms, mirroring how IFRS uses the advanced CMS. Core migration work stays largely intact. The Google Drive backup request is modest added effort since it mirrors existing S3 staging, but should factor into pricing. Both agreed platform limitations are Zoom's to answer and confirmed Mithun's Contact Center workflow access.

Quick Logistics Sync — Internal

Brief sync on a low-priority Salesforce data task for the following week (company, title, name, and Salesforce-flagged status across two sheets) and confirmation of an event registration link ahead of an upcoming work trip.

Earnings Practice Deep-Dive with Devin — Internal

Devin walked Mithun through OE's earnings and investor-day business. Devin reported roughly \$805K closed this year (\$418K Q1, \$313K Q2 to date) with very low closed-lost, and three to four

recent Computershare European wins. He explained pricing: four-packs (about 5% off) or eight-packs (about 10% off) at roughly \$2,950 per call plus add-ons including recording, international lines, rush transcription, and on-site technical directors; investor days range \$10K to \$100K, averaging \$15K to \$20K but reaching \$140K for full AV. The service spans from date confirmation through 24-hour post-event deliverables. ON24 skews to marketing webinars; Q4 and Notified are the main earnings-call players; OE's managed service and people are the real competitive moat. Mithun demoed the source-agnostic Vault Jump migration app including its S3-to-S3 path for obscure platforms like Okta's Circle HD.

OE Support Line + Zoom Contact Center Buildout — Internal

Mithun joined Alan, Max, and Tyler (Zoom) to align on the OE Support Line and Zoom Contact Center buildout ahead of a June 15 go-live. About 10 agents provisioned; Zoom-issued Mac laptops shipping around June 12–13 with an IT setup call to follow. The chat-to-video workflow already runs end to end. OE holds four trial Elite licenses, valued for AI engagement briefs and quality-management analysis. Tyler will raise licensing and possible Zoom PSO implementation help with Rajul and Chris Morrissey. Alan favored proving value first, likely five free support visits before charging. Next step: bring the OE team in via Amelia for a launch and knowledge-alignment call. Strategic upside: support line generates event-management leads for OE and drives sticky Zoom license adoption, with potential for OE to become a paid tier-2 Zoom support partner.

Thursday, June 4

2 meetings

IFRS Migration Standup — Caption Bug, Manual Migration Status, Vault Jump — Internal

In the Thursday standup with Max, Meet, Kiran, and Akash, a major caption issue surfaced: the migration report showed a large number of videos had dropped caption files. Kiran traced the root cause — an SRT-to-VTT conversion function written but never wired into the pipeline, causing SRT caption files to be silently dropped. Kiran committed to a fix within the hour. Spot-checking confirmed three of four sampled videos had WebVTT captions; only the SRT-sourced one was missing. Max's call with IFRS client Ryan was scheduled for 6pm UK time. On manual migration: all error-ingestion Kaltura entries were migrated with metadata, with two exceptions where the underlying files were corrupt. Four of eight manually migrated entries had tags exceeding Zoom's character limit (the tag was the full video title), an edge case not seen across the 2,000-plus main run. Max also rebuilt eight Kaltura quiz videos into Zoom by manually adding polls, noting Kaltura supports time-stamped questions at multiple video points while Zoom allows only a single poll at one timestamp. Channel assignment remained pending on Zoom's side.

GCS / Zoom Sales Team Weekly — Internal

KC closed Paul Hastings; DocuSign is pending at approximately \$25K. Peter had a positive Louis Vuitton call (two events per year, single event committed for now) and received a CMS inbound from a Zoom AE after months of prospecting. The most significant loss: American Bankers Association, representing approximately \$200K and around 175 webinars per year, declined due to Zoom's lack of a native slide-upload feature that ON24 provides, with the client citing screen-sharing risk. The team formalized this as recurring product feedback for Zoom. David confirmed 10 Zoom-issued Mac laptops shipping around June 15, granting OE staff OP portal access for viewing customer account settings and licensing. Andrew announced a June spiff paying 200% of individual comp rate for deals that bring in a new department or buyer within an existing account. Amelia is coordinating a 30-minute Zoom enablement call with Mithun and Max for the coming weeks.

Friday, June 5

3 meetings

IFRS Migration — Caption Fix Progress, Citi Hours Estimate, Corporate OAuth Setup — Internal

Friday's standup covered three open threads. Kiran resolved the SRT-to-VTT bug and reran the caption script, but a second issue surfaced: captions were uploading to S3 and Zoom but failing to link to the correct entity IDs due to Zoom returning 500 errors. Kiran built a polling script checking every minute for missing caption URL links; the fresh report was expected within 2.5 to 3 hours. One failed video (07U52KELC) remains with Zoom's Bo. On Citi, Max asked Akash for an effort estimate for sales; Akash estimated 24 to 30 hours combined with another engineer over 3 to 4 days, and Max contributed roughly 10 hours of script writing and weekend monitoring, putting the combined total at approximately 40 hours. For Vault Jump, Max noted testing has been on the sandbox Zoom account, but Okta and Indeed target ZVM licenses in the corporate account; Akash was directed to create an OAuth app under the corporate account after completing the caption work. Mithun and Max plan to meet Monday to finalize the IFRS report ahead of the full client call Tuesday.

Indeed Retention-Policy Resolution — ZVM Clips Exemption Confirmed — Internal

On Friday's follow-up from the Wednesday retention escalation, Kara, Max, and Mithun joined Vijay (Zoom ZVM PM), Andrew (Zoom video-management), and Bo (Zoom engineering). Vijay confirmed Zoom Whiteboard already has a "save starred" setting exempting favorited items from retention deletion, and since Clips shares the same architecture, the same feature is straightforward to implement. Vijay has written the engineering story, targeting mid-July with intent to accelerate. The build includes a bulk API so OE can programmatically star migrated clips on behalf of users during migration, ensuring nothing is auto-deleted before users can act. Vijay is also scoping a second exemption for clips added to ZVM channels. On embed codes, the list-channel-videos API returns a play_link field from which OE can construct embed codes programmatically, enabling a dual-link handoff report (old Kaltura URLs and new Zoom URLs) for Indeed's re-embedding work. Vijay will update Indeed via the shared chat channel; Andrew will be on Monday's client call.

Kaltura Caption File Type Mismatch Investigation — Internal

Max, Akash, and Mithun investigated caption processing failures. Max identified that Kaltura's API reports certain files as SRT while the actual downloaded files are already in VTT format, and hypothesized OE's script was performing a redundant or incorrect conversion on files already in VTT, producing output Zoom could not process. This mirrored the earlier corrupt video issue where Kaltura reported MP4 but the actual content was a different format. Akash confirmed approximately 1,200 SRT-flagged caption files exist in S3 and committed to auditing actual file types against Kaltura API metadata before next week's client call.

Looking Ahead — Week 17 / Action Items

IFRS Final Report + Client Presentation — Max, Mithun

Mithun and Max to meet Monday to polish the migration report, incorporating the caption patch results, JSON file counts, permanent-hold reason columns, and manual migration notes. Full IFRS client presentation call scheduled for Tuesday.

Indeed Monday Call — Max, Kara, Andrew

Present Zoom's retention solution (starred clips exemption and bulk API, mid-July target with acceleration intent), the embed-code mapping approach for the dual-link handoff report, and scope the Google Drive backup request as potential added-scope line item.

Caption File Audit — Akash

Audit approximately 1,200 SRT-flagged caption files in S3 against Kaltura API metadata to confirm whether Kaltura is misreporting file types. Fix migration script to handle the mismatch before it recurs on subsequent engagements.

Vault Jump OAuth + ZVM Testing — Akash

Create an OAuth app under the corporate Zoom account to begin testing the migration bot against real ZVM licenses, in preparation for the Okta and Indeed migrations that both target Zoom Video Management.

Zoom Enablement Call — Mithun, Max

Amelia to schedule the 30-minute call with Mithun, Max, and the Zoom enablement team to align on talk tracks and deliverables. Max requested the same Zoom contacts attend as prior calls to avoid repeating prior briefings.
